Chapter 10:
Spacious Skies And Tilted Axes Summary

Fertile Crescent is in Eurasia, also known as Europe and Asia. The Fertile Crescent is where crops come from. This is one of the major crop growing areas.

Agriculture as most of us know is farming and crop growth. The Fertile Crescent is a great example of good agriculture. Agriculture was so great in Eurasia because the west to east axis make a lot of the area similar. The Greeks called it Mesopotamia of "between the rivers" because it is located between the Tigris and Euphrates Rivers

Axis was a very important part of agriculture because in some areas climate wasn't as well. For example in the Americas and Africa the axes run north and south. so only near the middle the weather is real good for agriculture but in Eurasia it goes from east to west and that span is closer to the equator there for making it good for farming .The major problem with the axis was because it went from north to south it had many different climates and weather patterns that some crops could grow in and others couldn't.

Eurasia has a lot of crops growth because that is where the Fertile Crescent is found. Crops grow faster and spread is much greater. The axis in Eurasia runs west to east unlike the other areas. Wheat, barley, lentil, chickpea, beans and peas where grown in Eurasia. Since the axis runs from east to west climates are similar which means that you could grow the same crops in different areas. There were also productions such as the wheel, writing, metalworking, techniques, milking, fruit trees, beer and wine production.
