

### **Summary – Spacious skies and tilted axis**

This chapter explains how and why some continents were better developed than others, in the terms of the export of natural resource, as well as jewelry, food or even animals, and many other products too.

It all pretty much started in the Fertile Crescent. All the products would come from there. The Fertile Crescent was located in the Middle Eastern near Iraq. But the products were only spreading by East-West axis. So the continents in the east and west sides of the Fertile Crescent were Eurasia and North Africa. That happened successfully because of the Fertile Crescent, Eurasia and North Africa shared the same Latitude. The same Latitude makes places to have the same regimes of temperature, length of day and same diseases.

All that can happen to the North-South axis, exactly because of the Latitude, when the places don't share the same Latitude, the products, mainly food, won't grow healthily or it won't grow at all. That's what happens in Africa and America's. When they don't have the same Latitude, spread crops, technologies and animals, isn't possible.
